Pre-Feasibility Study of the Trans-Korean Peninsula Pipeline

Ken Asakura*
General Secretary, National Pipeline Research Society of Japan Research Director, Mitsubishi Research Institute
Tokyo, Japan

INTRODUCTION

Economic growth in the Asia-Pacific region is expected to stimulate concomitant growth in energy demand. Between 1989 and 2000, aggregate energy consumption in this region is expected to increase by 70%. But no dramatic increase in petroleum supply can be anticipated. Moreover, petroleum and its products are now considered environmentally "unfriendly." Thus, developed NEA countries are hoping to utilize natural gas which has the added benefit of being much less harmful to the environment.

To increase the intra-regional use of environmentally-clean natural gas, the National Pipeline Research Society of Japan proposes the construction of international trunk pipelines, collectively called the "Trans-Asian Natural Gas Pipeline Network," linking the gas fields in developing NEA with major consumer markets. This Trans-Asian Pipeline will play a vital role in the international infrastructure of the 21st century and assist in finding a solution to problems involving global environmental issues and long-lasting security in Asia. This paper presents a preliminary analysis of some pipeline projects in NEA, as a part of the Trans-Asian Natural Gas Pipeline Network, focusing especially on the Trunk Pipeline Project from the West Baikal natural gas fields to Japan.

NATURAL GAS DEMANDS IN NORTHEAST ASIA

Total primary energy demand in Asia is expected to double from 1992 to 2010. Natural gas demand is also expected to increase by 2.8 times for

^{*}The views described in this paper are those of the author and do not necessarily reflect the views of the National Pipeline Research Society of Japan.

Asia, and 2.5 times for NEA in the same period (Table 1). On March 3, 1995, the First International Conference on Northeast Asian Natural Gas Pipelines was organized by the National Pipeline Research Society of Japan in Tokyo. On this occasion, China, South Korea and Japan presented the projected natural gas demands for their countries. In 2010, natural gas demand for these countries and Taiwan is expected to be 2.6-2.9 times that of 1994 (Table 2), implying that 181 BCM of gas will be required in 2010. This gas will likely be imported as LNG through international pipelines.

INTERNATIONAL PIPELINE PROJECT FROM WEST BAIKAL

The most important project in the Northeast Asian Natural Gas Pipeline Network would be an international trunk pipeline from West Baikal (Figure 1). The international pipeline would be divided into two sections: the Koviktsinskoye gas field to Beijing, and Beijing to Kita-Kyushu (Japan). The first section would run via Mongolia (B-Line) and the other via Manchuria (A-Line). There are three alternatives for the latter section: via the Korean Peninsula (C-Line), via the Yellow Sea and South Korea (D-Line) and via the East China Sea (E-Line) (Figure 1). The pipeline lengths are shown in Table 3.

GAS VOLUME TRANSPORTED

The volume of natural gas delivered to each country from Koviktsinskoye field is assumed to be 10.0 BCM/Y for Irkutsk, 8.0 BCM/Y for China, 10.0 BCM/Y for South Korea and 10.0 BCM/Y for Japan (Table 4). This assumption is feasible based on our survey of Koviktsinskoye gas field and the natural gas demand of each country.

COST ESTIMATES AND GAS TARIFF

Based on these assumptions of transported natural gas, we have simulated the dynamic gas flow and determined the required thickness and diameter of the pipe and the compressor specifications (Table 5). The operating ratio of the pipeline is assumed to be 80%. Material costs include pipes, compressors and valves. The construction costs consider the ground conditions, i.e., flat desert (0.008 M\$/inch·km), rocky mountain (0.011 M\$/inch·km), swamp (0.011 M\$/inch·km) and seabed (0.05 M\$/inch·km). Control, monitoring and design/engineering costs have also been calculated. The construction period is estimated at 5 years and the project period is 20 years. The interest on investment is taken as 8% and the secured profit as 5% for the gas price.

Table 1 Natural Gas Demand in Asia (MTOE)

| | 1992 | 2000 | 2010 |

Table 4 Natural Gas Volume Delivered to Each Country

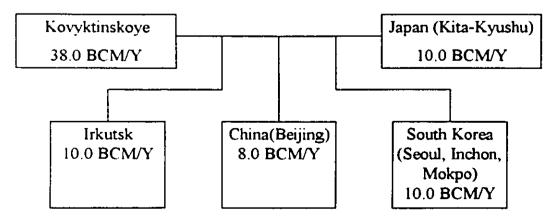

Table 5 Pipe Specifications

| Route | Material | Diameter | Thickness |
|----------------------------|------------|----------|-----------|
| Kovyktinskoye-Beijing | API 5LX-65 | 56" | 20,6 mm |
| Beijing-Seoul or Rizhao | API 5LX-65 | 48" | 17.5 mm |
| Shangdong Peninsula-Inchon | API 5LX-65 | 52" | 23.8 mm |
| Rizhao-Mokpo | API 5LX-65 | 56" | 23.8 mm |
| Seoul-Kita/Kyushu | API 5LX-65 | 40" | 15.9 mm |
| Mokpo-Kita/Kyushu | API 5LX-65 | 46" | 20.6 mm |

The grand total construction costs are: the A-Line—14,600 M\$; the B-Line—10,666 M\$; the C-Line—5,875 M\$; the D-Line—6,792 M\$; the E-Line—10,151 M\$ (Appendices A-D). Thus, if the wellhead price of gas is 0.5\$/MMBTU or 0.02 \$/m³, the gas tariff at Beijing would be 1.99\$/MMBTU for the A-Line and 1.59\$/MMBTU for the B-Line. The B-Line would thus be more economical than the A-Line. The gas tariff at Kita-Kyushu would be 2.90\$/MMBTU for the C-Line, 3.18 \$/MMBTU for the D-Line and 3.96\$/MMBTU for the E-Line, using the B-Line for Irkutsk-Beijing (Figure 2). The C-Line would thus be the most economical from a technical perspective. However, the above calculation did not consider the transit royalty to be paid for third countries. Moreover, based on the recent contribution of the Europe-Magreb International Pipeline, the construction cost may be reduced by as much as 35% from the initial estimate because of the strong influence of recent price decreases in Europe (Appendix E).

Therefore another calculation should be executed to obtain a more precise assessment of the gas tariff. This calculation adds two conditions:

- (1) a transit royalty of 0.03\$/MMBTU for 100 km of the third country (Appendix 2); and
- (2) a construction cost reduction of 35%.

The result is that the gas tariff at Kita-Kyushu would then be 3.21-4.02\$/MMBTU for the C-Line, 3.28-4.18\$/MMBTU for the D-Line and 3.68-4.85\$/MMBTU for the E-Line (Figure 3). The C-Line would still be the most economical.

Figure 2

ESTIMATED GAS TARIFF FROM WEST BAIKAL

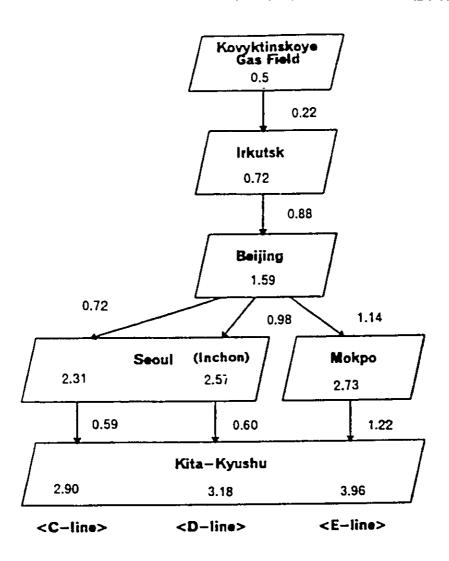

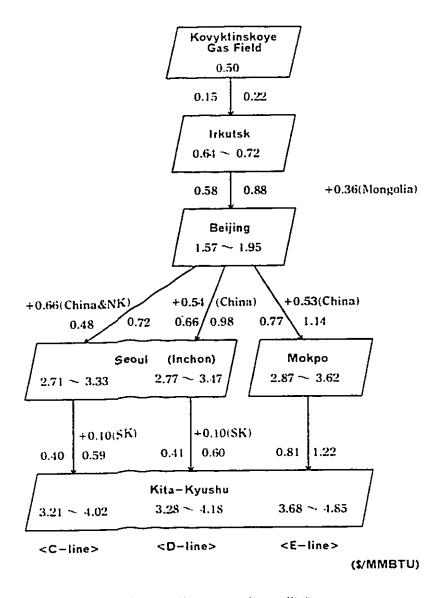

Figure 3

ESTIMATED GAS TARIFF FROM WEST BAIKAL (2)

Note: 1) Figures with "+" indicate "transit royality".
2) Left-side figures indicate those of the cases with reduction of construction cost by 35%.
